CS 3750

Assignment 1 Technologies used

For this assignment I used ASP.NET Core utilized with razor pages. This gave me the web framework to work with. I also used bootstrap to design the web pages and Microsoft SQL Server to create the database that I would be using. In terms of programming languages I used C# for the logic and database interactions, html for structuring the webpages, and css (which was integrated via bootstrap to handle the styling of the website). During this assignment I also had frequent interactions with the NuGet packet manager and the Package manager Console to handle the migration steps in building the database.
